Implementing a Security Risk Management System (SRMS)

To introduce a security risk management system at your facility you will require time and resources. You will be introducing change that will result in a range of benefits, but to be successful and manage fear of change, you will need the commitment of top management. This chart will guide you through the key stages of security risk management system implementation and identifies a range of resources that can help you be successful and maximise the benefits of good facility security.

Stage	1 Commitment	2 Gap Analysis	3 Plan	4 Implement	5 Operate	6 Assurance
What's Required?	A clear rationale for change: • Effective security • Value for money • Risk reduction • Improved procurement • Asset marketability • Corporate social responsibility (CSR)	A good understating of your current approach to facility security. Clear aspiration for the future of security at the facility.	A realistic plan that will: • deliver the targeted improvements. • identifies any technical support required. • identifies any organisational support required. A realistic budget and timescale that meets management expectations.	Availability of technical and operational resources to deliver and document the various components of the Security Risk Management System (SRMS).	A Security Manager operates and maintains the SRMS. The Responsible Person reviews performance and effectiveness of the SRMS.	Independent 3rd party assessment and certification of the SRMS. Communicate achievements to Interested Parties.
